

Logit Regression | SAS Data Analysis Examples Logistic regression, also called a logit model, is used to model dichotomous outcome variables. In the logit model the log odds of the outcome is modeled as a linear combination of the predictor variables.
Logistic Regression & Classification - Stony Brook

Logistic regression model is the most popular model for binary data. Logistic regression model is generally used to study the relationship between a binary response variable and a group of predictors (can be either continuous and a group of predictors (can be either continuous
